File Index

1.1 File List

Here is a list of all documented files with brief descriptions:

/Users/FabianFranz/Development/Projects/AVRCubeRev2/AvrCubeV2Code/src/ main.cpp	
Implementation of functionality for the "Cube Project"	3
/Users/FabianFranz/Development/Projects/AVRCubeRev2/AvrCubeV2Code/src/ main.hpp	
Includes, defines and function prototypes for the "Cube Project"	13

Chapter 2

File Documentation

2.1 /Users/FabianFranz/Development/Projects/AVRCubeRev2/AvrCube↵ V2Code/src/main.cpp File Reference

Implementation of functionality for the "Cube Project".

```
#include "main.hpp"
```

Functions

- `int main ()`
- `void calibrate ()`
Short calibration of the MMA8653FC values.
- `void setLedPins (uint8_t mode)`
Set the LED Pins eigther "INPUT" or "OUTPUT".
- `void setSDA (bool mode)`
Set the SDA pin eigther "ON" or "OFF".
- `void setSCL (bool mode)`
Set the SCL pin eigther "ON" or "OFF".
- `void init ()`
Initialises all the AVR hardware E.g. ports, interrupts, timers, etc.
- `void allLedOn ()`
Turn on all LEDs (LED1 - LED7)
- `void allLedOff ()`
Turn off all LEDs (LED1 - LED7)
- `void deInit ()`
Deinitialises all the AVR hardware E.g. ports, interrupts, timers, etc.
- `void showNumber (uint8_t numberToShow)`
Show a number between 1 and 6 on the LEDs.
- `void showCross ()`
Show a cross on the LEDs.
- `void showHook ()`
Show a hook on the LEDs.

- void `testLeds` ()
Check if all LEDs are working correctly.
- void `start` ()
I2C BitBang start condition.
- void `stop` ()
I2C BitBang stop condition.
- bool `tx` (uint8_t dat)
I2C BitBang tx of one byte.
- uint8_t `rx` (bool ack)
I2C BitBang rx of one byte.
- uint8_t `readRegister` (uint8_t reg)
Read a register from the MMA8653FC.
- void `writeRegister` (uint8_t reg, uint8_t value)
Write a value to a register of the MMA8653FC.
- void `testI2C_read` ()
Checks, if the I2C connection to the MMA8653FC is working.
- void `MMA8653FC_init` ()
Initialise the MMA8653FC range and mode.
- void `MMA8653FC_deinit` ()
Deinitialise the MMA8653FC to save energy.
- void `getAcceleration` (int16_t *x, int16_t *y, int16_t *z)
Read the acceleration data from the MMA8653FC.
- bool `motionDetected` (uint8_t threshold)
Get's true, if the device is in motion and threshold is reached.
- void `dynamicDelay` (uint16_t ms)
Implementation of a variable delay.
- void `dice` ()
Realises a random number from 1 - 6 and show it on the LEDs.
- float `getAngle` (float axis, float reference)
Get the Angle between two acceleration values.
- void `spritLevel` ()
Shows the sprit level on the LEDs.
- void `goToSleep` ()
- `cli` ()
- `while` (!(PINB &(1<< BUTTON)))
- `if` (force_sleep_counter >=FORCE_SLEEP_TIME)
- `sei` ()

Variables

- volatile uint16_t `counter` = 0
- volatile uint8_t `button_pressed` = 0
- int16_t `x_offset`
- int16_t `y_offset`
- int16_t `z_offset`
- `else`

2.1.1 Detailed Description

Implementation of functionality for the "Cube Project".

2.1.2 Function Documentation

2.1.2.1 `calibrate()`

```
void calibrate ( )
```

Short calibration of the MMA8653FC values.

Remarks

The calibration will first check if the device can be reached via the I2C connection. If not, it will show a cross on the LEDs and go to sleep. After that, it will read the current acceleration values and get the offset. The offset will be stored in the non persistent memory of the device. It is used to compensate the offset for angle calculation and motion detection.

2.1.2.2 `deInit()`

```
void deInit ( )
```

Deinitialises all the AVR hardware E.g. ports, interrupts, timers, etc.

Remarks

Calling `deInit()`; is necessary to save power before the CPU goes to sleep.

2.1.2.3 dice()

```
void dice ( )
```

Realises a random number from 1 - 6 and show it on the LEDs.

Remarks

It will first generate and show some random numbers with a long delay between them. Then the delay gets shorter. Finally, it will persistently show a random number on the LEDs. The function can only be stopped by external interrupt.

2.1.2.4 dynamicDelay()

```
void dynamicDelay (
    uint16_t ms )
```

Implementation of a variable delay.

Parameters

<i>ms</i>	The time you want the core to not execute any code.
-----------	---

2.1.2.5 getAcceleration()

```
void getAcceleration (
    int16_t * x,
    int16_t * y,
    int16_t * z )
```

Read the acceleration data from the MMA8653FC.

Parameters

<i>x</i>	The x-axis acceleration data (call by reference).
<i>y</i>	The y-axis acceleration data (call by reference).
<i>z</i>	The z-axis acceleration data (call by reference).

```
// usage example
int16_t x, y, z;
MMA8653FC_read(&x, &y, &z);
```

2.1.2.6 getAngle()

```
float getAngle (
```

```
float axis,  
float reference )
```

Get the Angle between two acceleration values.

Parameters

<i>axis</i>	The orthogonal axis of device rotation.
<i>reference</i>	The reference acceleration value of the other axis.

Returns

float Resulting angle in degree.

Remarks

The function is used to calculate the angle between a reference acceleration value and the acceleration value of the axis where the amount of acceleration is changing. A best practise to calculate the angle would be:

1. Read all the acceleration values from the sensor (x, y, z).
2. Calculate the amount of motion on those axis where the acceleration doesn't change significantly. E.g.:
`amount = sqrt(y * y + z * z);`
3. Calculate the angle between the amount of motion and the acceleration value of the axis where the amount of motion is changing. E.g.:
`angle = getAngle(x, amount);`
4. Use the angle to calculate the rotation of the device. For further information read: <https://www.nxp.com/docs/en/application-note/AN3461.pdf>

2.1.2.7 motionDetected()

```
bool motionDetected (  
    uint8_t threshold )
```

Get's true, if the device is in motion and threshold is reached.

Parameters

<i>threshold</i>	Activation threshold in bit.
------------------	------------------------------

Returns

true if threshold is reached.

2.1.2.8 readRegister()

```
uint8_t readRegister (  
    uint8_t reg )
```

Read a register from the MMA8653FC.

Parameters

<i>reg</i>	The register to read.
------------	-----------------------

Returns

The value of the register.

2.1.2.9 rx()

```
uint8_t rx (  
           bool ack )
```

I2C BitBang rx of one byte.

Parameters

<i>ack</i>	ACK or NACK (acknowledge or no acknowledge)
------------	---

Returns

The received byte.

2.1.2.10 setLedPins()

```
void setLedPins (  
                uint8_t mode )
```

Set the LED Pins either "INPUT" or "OUTPUT".

Parameters

<i>mode</i>	OUTPUT = 0 or INPUT = 1
-------------	-------------------------

2.1.2.11 setSCL()

```
void setSCL (  
            bool mode )
```

Set the SCL pin either "ON" or "OFF".

Parameters

<i>mode</i>	"ON" (input pullup) or "OFF" (output low)
-------------	---

2.1.2.12 setSDA()

```
void setSDA (
    bool mode )
```

Set the SDA pin either "ON" or "OFF".

Parameters

<i>mode</i>	"ON" (input pullup) or "OFF" (output low)
-------------	---

2.1.2.13 showCross()

```
void showCross ( )
```

Show a cross on the LEDs.

Remarks

This function is used to indicate some error.

2.1.2.14 showHook()

```
void showHook ( )
```

Show a hook on the LEDs.

Remarks

This function is used to indicate some success.

2.1.2.15 showNumber()

```
void showNumber (
    uint8_t numberToShow )
```

Show a number between 1 and 6 on the LEDs.

Parameters

<i>numberToShow</i>	The number to show on the LEDs.
---------------------	---------------------------------

Remark If the number is larger than 6, no LED will be turned on.

2.1.2.16 spritLevel()

```
void spritLevel ( )
```

Shows the sprit level on the LEDs.

Remarks

The function internally calculates the roll and the nick angle of the device. It then uses the calculated angles to show in which direction the device is rotated. When it is at rest, only the LED in the middle will be turned on. When the device is rotated, the LEDs on the corresponding side will be turned on.

2.1.2.17 start()

```
void start ( )
```

I2C BitBang start condition.

2.1.2.18 stop()

```
void stop ( )
```

I2C BitBang stop condition.

2.1.2.19 testI2C_read()

```
void testI2C_read ( )
```

Checks, if the I2C connection to the MMA8653FC is working.

Remarks

If the communication is not working, it will be shown on the LEDs as a cross. Furthermore, the device will go to sleep.

2.1.2.20 testLeds()

```
void testLeds ( )
```

Check if all LEDs are working correctly.

2.1.2.21 tx()

```
bool tx (
    uint8_t dat )
```

I2C BitBang tx of one byte.

Parameters

<i>dat</i>	The byte to send.
------------	-------------------

Returns

ACK or NACK (acknowledge or no acknowledge)

2.1.2.22 writeRegister()

```
void writeRegister (
    uint8_t reg,
    uint8_t value )
```

Write a value to a register of the MMA8653FC.

Parameters

<i>reg</i>	The register to write.
<i>value</i>	The value to write.

2.1.3 Variable Documentation

2.1.3.1 else

```
else
```

Initial value:

```
{
    _delay_ms(10)
```

2.2 /Users/FabianFranz/Development/Projects/AVRCubeRev2/AvrCubeV2Code/src/main.hpp File Reference

Includes, defines and function prototypes for the "Cube Project".

```
#include <math.h>
#include <stdlib.h>
#include <avr/io.h>
#include <avr/sleep.h>
#include <util/delay.h>
#include <avr/interrupt.h>
```

- `#define MMA8653FC_OUT_Z_LSB 0x06`

Functions

- void `setLedPins` (uint8_t mode)
Set the LED Pins either "INPUT" or "OUTPUT".
- void `setSDA` (bool mode)
Set the SDA pin either "ON" or "OFF".
- void `setSCL` (bool mode)
Set the SCL pin either "ON" or "OFF".
- void `init` ()
Initialises all the AVR hardware E.g. ports, interrupts, timers, etc.
- void `allLedOn` ()
Turn on all LEDs (LED1 - LED7)
- void `allLedOff` ()
Turn off all LEDs (LED1 - LED7)
- void `delInit` ()
Deinitialises all the AVR hardware E.g. ports, interrupts, timers, etc.
- void `showNumber` (uint8_t numberToShow)
Show a number between 1 and 6 on the LEDs.
- void `showCross` ()
Show a cross on the LEDs.
- void `showHook` ()
Show a hook on the LEDs.
- void `testLeds` ()
Check if all LEDs are working correctly.
- void `start` ()
I2C BitBang start condition.
- void `stop` ()
I2C BitBang stop condition.
- bool `tx` (uint8_t dat)
I2C BitBang tx of one byte.
- uint8_t `rx` (bool ack)
I2C BitBang rx of one byte.
- uint8_t `readRegister` (uint8_t reg)
Read a register from the MMA8653FC.
- void `writeRegister` (uint8_t reg, uint8_t value)
Write a value to a register of the MMA8653FC.
- void `testI2C_read` ()
Checks, if the I2C connection to the MMA8653FC is working.
- void `MMA8653FC_init` ()
Initialise the MMA8653FC range and mode.
- void `MMA8653FC_delInit` ()
Deinitialise the MMA8653FC to save energy.
- void `getAcceleration` (int16_t *x, int16_t *y, int16_t *z)
Read the acceleration data from the MMA8653FC.
- bool `motionDetected` (uint8_t threshold)
Get's true, if the device is in motion and threshold is reached.
- void `dynamicDelay` (uint16_t ms)
Implementation of a variable delay.
- void `dice` ()
Realises a random number from 1 - 6 and show it on the LEDs.
- float `getAngle` (float axis, float reference)

Get the Angle between two acceleration values.

- void `spritLevel` ()

Shows the sprit level on the LEDs.

- void `calibrate` ()

Short calibration of the MMA8653FC values.

2.2.1 Detailed Description

Includes, defines and function prototypes for the "Cube Project".

2.2.2 Function Documentation

2.2.2.1 `calibrate()`

```
void calibrate ( )
```

Short calibration of the MMA8653FC values.

Remarks

The calibration will first check if the device can be reached via the I2C connection. If not, it will show a cross on the LEDs and go to sleep. After that, it will read the current acceleration values and get the offset. The offset will be stored in the non persistent memory of the device. It is used to compensate the offset for angle calculation and motion detection.

2.2.2.2 deInit()

```
void deInit ( )
```

Deinitialises all the AVR hardware E.g. ports, interrupts, timers, etc.

Remarks

Calling `deInit()`; is necessary to save power before the CPU goes to sleep.

2.2.2.3 dice()

```
void dice ( )
```

Realises a random number from 1 - 6 and show it on the LEDs.

Remarks

It will first generate and show some random numbers with a long delay between them. Then the delay gets shorter. Finally, it will persistently show a random number on the LEDs. The function can only be stopped by external interrupt.

2.2.2.4 dynamicDelay()

```
void dynamicDelay (
    uint16_t ms )
```

Implementation of a variable delay.

Parameters

<i>ms</i>	The time you want the core to not execute any code.
-----------	---

2.2.2.5 getAcceleration()

```
void getAcceleration (
    int16_t * x,
    int16_t * y,
    int16_t * z )
```

Read the acceleration data from the MMA8653FC.

Parameters

<i>x</i>	The x-axis acceleration data (call by reference).
<i>y</i>	The y-axis acceleration data (call by reference).
<i>z</i>	The z-axis acceleration data (call by reference).

```
// usage example
int16_t x, y, z;
MMA8653FC_read(&x, &y, &z);
```

2.2.2.6 getAngle()

```
float getAngle (
    float axis,
    float reference )
```

Get the Angle between two acceleration values.

Parameters

<i>axis</i>	The orthogonal axis of device rotation.
<i>reference</i>	The reference acceleration value of the other axis.

Returns

float Resulting angle in degree.

Remarks

The function is used to calculate the angle between a reference acceleration value and the acceleration value of the axis where the amount of acceleration is changing. A best practise to calculate the angle would be:

1. Read all the acceleration values from the sensor (x, y, z).
2. Calculate the amount of motion on those axis where the acceleration doesn't change significantly. E.g.:
`amount = sqrt(y * y + z * z);`
3. Calculate the angle between the amount of motion and the acceleration value of the axis where the amount of motion is changing. E.g.:
`angle = getAngle(x, amount);`
4. Use the angle to calculate the rotation of the device. For further information read: <https://www.nxp.com/docs/en/application-note/AN3461.pdf>

2.2.2.7 motionDetected()

```
bool motionDetected (
    uint8_t threshold )
```

Get's true, if the device is in motion and threshold is reached.

Parameters

<i>threshold</i>	Activation threshold in bit.
------------------	------------------------------

Returns

true if threshold is reached.

2.2.2.8 readRegister()

```
uint8_t readRegister (
    uint8_t reg )
```

Read a register from the MMA8653FC.

Parameters

<i>reg</i>	The register to read.
------------	-----------------------

Returns

The value of the register.

2.2.2.9 rx()

```
uint8_t rx (
    bool ack )
```

I2C BitBang rx of one byte.

Parameters

<i>ack</i>	ACK or NACK (acknowledge or no acknowledge)
------------	---

Returns

The received byte.

2.2.2.10 setLedPins()

```
void setLedPins (
    uint8_t mode )
```

Set the LED Pins either "INPUT" or "OUTPUT".

Parameters

<i>mode</i>	OUTPUT = 0 or INPUT = 1
-------------	-------------------------

2.2.2.11 setSCL()

```
void setSCL (
    bool mode )
```

Set the SCL pin either "ON" or "OFF".

Parameters

<i>mode</i>	"ON" (input pullup) or "OFF" (output low)
-------------	---

2.2.2.12 setSDA()

```
void setSDA (
    bool mode )
```

Set the SDA pin either "ON" or "OFF".

Parameters

<i>mode</i>	"ON" (input pullup) or "OFF" (output low)
-------------	---

2.2.2.13 showCross()

```
void showCross ( )
```

Show a cross on the LEDs.

Remarks

This function is used to indicate some error.

2.2.2.14 showHook()

```
void showHook ( )
```

Show a hook on the LEDs.

Remarks

This function is used to indicate some success.

2.2.2.15 showNumber()

```
void showNumber (
    uint8_t numberToShow )
```

Show a number between 1 and 6 on the LEDs.

Parameters

<i>numberToShow</i>	The number to show on the LEDs.
---------------------	---------------------------------

Lremark If the number is larger than 6, no LED will be turned on.

2.2.2.16 spritLevel()

```
void spritLevel ( )
```

Shows the sprit level on the LEDs.

Remarks

The function internally calculates the roll and the nick angle of the device. It then uses the calculated angles to show in which direction the device is rotated. When it is at rest, only the LED in the middle will be turned on. When the device is rotated, the LEDs on the corresponding side will be turned on.

2.2.2.17 start()

```
void start ( )
```

I2C BitBang start condition.

2.2.2.18 stop()

```
void stop ( )
```

I2C BitBang stop condition.

2.2.2.19 testI2C_read()

```
void testI2C_read ( )
```

Checks, if the I2C connection to the MMA8653FC is working.

Remarks

If the communication is not working, it will be shown on the LEDs as a cross. Furthermore, the device will go to sleep.

2.2.2.20 testLeds()

```
void testLeds ( )
```

Check if all LEDs are working correctly.

2.2.2.21 tx()

```
bool tx (
    uint8_t dat )
```

I2C BitBang tx of one byte.

Parameters

<i>dat</i>	The byte to send.
------------	-------------------

Returns

ACK or NACK (acknowledge or no acknowledge)

2.2.2.22 writeRegister()

```
void writeRegister (
    uint8_t reg,
    uint8_t value )
```

Write a value to a register of the MMA8653FC.

Parameters

<i>reg</i>	The register to write.
<i>value</i>	The value to write.

2.3 main.hpp

[Go to the documentation of this file.](#)
